Contact Tracing and Disease Investigation Update

On December 14, 2020, Carson City Health and Human Services initiated the first phase of a new disease investigation process. A survey was created for cases that had been tested outside of the contact tracing window per CDC and Nevada State guidance. These individuals were previously contacted regarding their diagnosis, but limited information was collected at that time. With the new survey, we are now able to e-mail these individuals a link to collect more information about their exposure, demographics, and infection timeline.

Additionally, we adapted our disease investigation survey for individuals tested in the past six days in order to allow cases to complete the information online. This flexibility allows our contact tracers to successfully contact approximately double the amount of cases within a workday. We will continue to adjust these surveys and our processes as needed to collect accurate, timely data as well as provide our community with guidance. The information reported here is based on preliminary laboratory findings and completed survey investigation and does not necessarily represent all cases during this two-week period.

Quad-County Area Demographics

Across the Quad-County area (Carson City, Douglas, Lyon, and Storey Counties), there were 2,506 new COVID-19 cases in the two-week period from December 6 – 19, 2020, approximately equal to the previous two-week period (November 29 – December 12, 2020). The daily cases reported, based on a seven-day average, over this two-week period was one hundred and fifty-four (Graph 1). This indicates that, on average, there have been one-hundred and fifty-four new cases each day throughout the Quad-County area.

Because we receive labs with incomplete data and our survey data is on a delay, the following demographic data has a significant percentage of unknown or missing information. The average age across all counties was forty-six years old with a range of less than a year old to one-hundred and two
years old. Thirty-five percent of cases were female, fifty-six percent were male, and nine percent were unknown. Of the cases that reported their race, seventy-six percent were reported as White, seventeen percent cases were reported as other, three percent were reported as American Indian, one percent were reported as Asian, one percent were reported at Native Hawaiian or Pacific Islander, one percent reported as Black or African American, and one percent preferred not to answer. Of those who reported their ethnicity, seventy-eight percent reported as Non-Hispanic or Latino/a, twenty-one percent reported as Hispanic or Latino/a, and one percent preferred not to answer. According to the Nevada Hospital Association, thirty-seven percent of staffed hospital beds in the Quad-county were currently occupied due to confirmed COVID-19 cases as of December 17, 2020, a slight increase from the previous week. There were thirty-nine deaths across the four counties during this two-week period, an eighty-five percent increase from the previous two-week period.

Quad-County Area Exposure

Following state approval, our investigation process now collects data more efficiently. We reduced the number of exposure questions and, instead, prioritize information based on clusters and outbreaks. There were outbreaks at five long-term care facility that resulted in a number of hospitalizations and deaths. We also reported 871 prison-related cases (including inmates, employees, and family of employees), accounting for thirty-five percent of all cases reported during this two-week period. Of cases with complete information, the most common, known COVID-19 exposures (excluding prison-related cases) were community, facility-related, work, and household (Graph 2). Excluding prison-related cases, approximately thirty-nine percent of known exposures were community-related which is defined as any event or activity with individuals outside of the household. This can be family gatherings, weddings, funerals, birthday parties, political events, or any other similar activity. Twenty-nine percent were household cases, indicating that the transmission occurred within the immediate household. Fourteen percent were work-related. Thirteen percent of cases were related to long-term care or skilled nursing facilities. Student cases continue to increase across all counties. There were one hundred and thirty-two student case investigations completed from December 6 - 19, 2020, a fifty-nine percent increase from the previous two-week period.
Carson City Surveillance Summary

From December 6 - 19, 2020 there were 1,617 confirmed cases reported in Carson City. This represents sixty-five percent of all Quad-County cases during this two-week period and is a nineteen percent increase from the previous two-week period. The daily cases reported, based on a seven-day average, over this two-week period was one hundred and sixteen. This indicates that, on average, there have been one hundred and sixteen new cases each day throughout Carson City. Fifty-nine percent of cases were male, twenty-seven cases were female, and fourteen percent were unknown. The average age of Carson City cases was forty-six years old. There were sixty-three students that tested positive for COVID-19 during this two-week period. Our school biostatistician continues to work closely with Carson City schools to help slow the spread and follow the most recent CDC and state guidance.

Eighty-four percent of the prison-related cases were in Carson City. These cases account for forty-five percent of county cases during this two-week period. Excluding prison-related cases, approximately forty-one percent of known exposures were community-related. Twenty-two percent were from the household, and twenty-two percent were work related (Graph 3). Transmission trends are challenging to track or predict given the current upswing in cases and missing data. Due to this, Carson City Health and Human Services continues to promote messages regarding safe practices, social-distancing, and testing.
